

ACQUISITION OUTREACH SYSTEM

Partner Briefing - Home Services Roll-Up (HVAC / Plumbing / Electrical)

Prepared: July 8, 2026 | Covers: outreach infrastructure build, database cleaning and enrichment, ICP targeting, phone acquisition strategy, compliance guardrails, and immediate next steps.

Thesis context: acquire and roll up Arizona home-services companies (HVAC, plumbing, electrical) targeting a 6-year exit. This document brings any partner fully current on the deal-sourcing machine as of today.

Progress at a glance

Metric	Start of day	Now
Target companies (clean, deduped)	964 raw rows	906 unique companies
Owner names	629 (with junk)	620 verified-source
Owner cell numbers	195	197 (+ verification flags)
Dial-ready targets (name + cell)	147	186 overall / 43 in ICP band
Employee counts	0	~360 (301 database + ~60 researched)
Revenue / EBITDA estimates	0	119 (12%-of-revenue proxy)
ICP hot list (25-35 employees)	not defined	143 companies, 5 tiers
Call tracking infrastructure	none	Loaded 6-tab tracker + sync bridge

1. The Call Tracking System

The team runs on a purpose-built Google Sheets tracker (delivered as **Acquisition_Call_Tracker_v3.xlsx**, converted to Google Sheets and shared with all five callers: Xander, Bram, Andrew, Davis, TJ). Six tabs:

- **Dashboard** - auto-computes calls/week, decision-maker reach rate, meetings set and upcoming, overdue follow-ups, pipeline count and EBITDA by stage, per-caller activity, SMS texts due. The one number managed daily: **Overdue Follow-Ups, kept at zero.**
- **Companies** - the target database, one row per company, pre-loaded with all 906 targets sorted dial-ready-first by estimated EBITDA. Auto-computing columns (never typed in): Last Caller, Calls This Week, Total Calls, Last Call date.
- **Call Log** - one row per dial, every dial, including no-answers. This feeds every dashboard stat and the rotation logic.
- **SMS Nurture** - the monthly text list for owners who said no (details in section 5).
- **Lists** - dropdown values and the caller roster.
- **Read Me** - the team rules, printed where nobody can claim they didn't see them.

The three-route call outcome model

Every call to an owner ends in exactly one of three routes - this is the core discipline of the system:

Outcome	Route	What happens in the tracker
Good call: meeting agreed	Stage 3 - Meeting Set	Meeting date/time/place recorded; outcome turns green; dashboard counts it
No answer / not yet	Stays in Call Rotation	A DIFFERENT rep takes the next dial (fresh voice). Companies nobody called this week turn orange and are counted
Hard no	Stage X - SMS Nurture	Owner moves to the monthly text list. No more dials. Reduces reputation burn in a market where owners talk to each other

Caller rotation rationale: rotating five voices is for **reaching non-answerers**, not for re-pitching owners who declined. An owner who said no gets patience (monthly texts), not attrition - the 'no to one rep, yes to another' effect is real but operates over weeks and months, not days.

Pipeline stages

1 Not Contacted → 2 In Call Rotation → 3 Meeting Set → 4 Meeting Held → 5 NDA Signed → 6 Financials Received → 7 LOI Submitted → 8 Diligence → 9 Closed-Acquired. X = Said No (SMS nurture). Only the deal lead moves a company past stage 5.

Update infrastructure

- Google Drive connector lets Claude read the live sheet at any time.
- An **Apps Script sync bridge** (Code.gs, delivered) installs inside the sheet: Claude drops import files into Drive and triggers imports remotely; the team also gets a manual 'CRM Sync' menu. Formulas survive every import. Token-protected; revocable in one click. **Status: awaiting installation after the**

sheet swap.

- A companion single-file web CRM (dashboard, drag-and-drop pipeline board, call logging, CSV in/out matching the sheet) exists for solo call sessions - browser-local data only; the Google Sheet remains the single source of truth for the team.

2. The Database: Cleaning and Enrichment

Source: the team's scraped list of AZ HVAC/plumbing/electrical contractors (964 rows, built from ROC posting lists, Google Maps scraping, and site scrapes).

Cleaning pass

- 964 rows → **906 unique companies**. 41 'duplicates' were multi-branch operations (same owner, several cities) - merged into single rows with an Other Locations field, since you acquire the company, not the branch. Multi-location targets are typically the larger ones.
- 11 junk owner values removed ('Could not find QP Name'), multi-owner fields split into primary + co-owners, all phone numbers normalized, one buried extension extracted.
- 56 contacts flagged where the title (Instructor, Plumber, GM) suggests they cannot sell the company - marked 'verify decision maker'.

Apollo enrichment run (completed today, ~415 credits spent, ~17,600 remain)

Phase	Scope	Result
Company enrichment	734 unique domains (780 companies had usable websites; 126 had none)	357 domains matched (49%). 301 clean employee counts, 125 revenue estimates
Owner search (free)	257 companies missing any owner name	Real owner-level candidates found for only 37 companies (51 people) - the long tail is genuinely absent from B2B databases
Owner enrichment	51 candidates + 12 in-band ROC-named owners	54 enriched: verified emails, unmasked names, LinkedIn
Contact harvest (free)	Team's own 193 existing Apollo contacts	157 revealed mobiles cross-referenced; 17 cells recovered that never made the original export; DNC status captured
Web size research	158 unknown-size / possibly-undercounted companies via 5 parallel researchers	Evidence found for 97 (LinkedIn brackets, team pages, job posts, truck counts); ~50 look in-band

Honest read on match rates: sub-\$5M local trades businesses are thin in every commercial database - Apollo matched about half of companies and had usable owner data for far fewer. This is normal for the segment and is exactly why the plan layers ZoomInfo, state records, and skip tracing on top (section 4).

Data quality guardrails applied

- **Franchise contamination:** 36 rows rode on franchise or lead-gen umbrella domains (Service Experts, Roto-Rooter, One Hour, 'acrepairnearme'-type SEO sites) and returned the parent org's numbers - e.g. a local shop showing \$1B revenue. Parent-org financials were NULLED in the tracker and flagged VERIFY; they remain visible only in the master file.
- **EBITDA is a proxy:** no data vendor sells real EBITDA on private companies. Estimates are 12% of estimated revenue, labeled as such in every row's Notes, to be overwritten with real numbers post-NDA.
- **LinkedIn undercount:** Apollo headcounts derive largely from LinkedIn, which badly undercounts blue-collar firms (technicians don't make profiles). A '10-employee' plumbing company may really run 30.

Screening bands are widened accordingly.

- **Already-acquired flag:** one target (Harvey Plumbing) appears to belong to Pueblo Mechanical & Controls, a PE-backed roll-up - flagged, likely dead as a target, useful as a comp.

3. ICP and the Hot List

Defined ICP: **25-35 employees** - roughly \$4-8M revenue and \$500K-1.2M EBITDA in this trade. Big enough to have a manager layer and survive the owner's exit; small enough that PE platforms haven't picked it clean. Screening band widened to 18-50 to absorb the LinkedIn undercount.

The working target list is **ICP_hotlist_v2.xlsx** - 143 companies in five tiers:

Tier	Count	Definition	Next action
A	16	Size confirmed in-band; owner name + cell in hand	DIAL NOW
A2	27	Size estimated in-band from web evidence; owner cell in hand	Dial now; verify headcount on the call
B	16	Size confirmed; owner known; NO cell	ZoomInfo contact reveals (first spend)
B2	23	Size estimated; owner known or partial; NO cell	ZoomInfo reveals (second)
C	61	300+ Google reviews but size still unknown	ZoomInfo company enrichment to size them

Key insight from today: the constraint in the ICP band is **sizing, not phone numbers** - 605 of 906 companies have unknown headcount, and the real 25-35 targets are hiding in that pile. Every sizing action (ZoomInfo company enrich, first-call question, web evidence) graduates companies into the dial queue.

Every A2 size estimate carries its evidence ('LinkedIn: 11-50', 'website: 30+ technicians') and a confidence grade. Web evidence skews optimistic - treat estimates as 'probably right, verify on the call.' Headcount is a natural first-call question and the answer replaces the estimate.

4. Phone Number Acquisition Playbook

Current state: 197 owner cells across the database; 43 of the 143 ICP-tier companies are dial-ready. The plan to maximize numbers, ordered by cost per number:

#	Play	Cost	Notes
1	Apollo UI mobile reveals	Already paid (~26,400 unused direct-dial credits)	API reveal is disabled on this team's plan, but UI reveals work. Stage contacts, select all, 'Access mobile numbers'
2	Line-type scan of existing office numbers	~\$10 total (Twilio/Telnyx Lookup)	Micro shops' 'office' line is often the owner's cell (13/197 confirmed overlap). Every mobile-typed hit is a free owner cell
3	ZoomInfo trial	Trial credits (starts tomorrow)	Tier B/B2 contact reveals first, then Tier C/D company sizing. Trials are credit-tight: spend surgically, mid-size targets only

#	Play	Cost	Notes
4	Skip tracing	\$0.10-0.25/hit (BatchSkipTracing, REISkip)	The volume play for small-business owners: owner name + address (from ROC / AZ Corp Commission) → 70%+ personal-cell hit rates. ~\$100-150 covers the full gap
5	State records fill	Free, slower	ROC qualifying-party lookups + AZ Corporation Commission filings convert the 286 nameless companies into skip-traceable names
6	Clay waterfall	~\$149/mo	Multi-vendor phone waterfall; worth it only when expanding beyond AZ

ROC phone number insight: the Arizona Registrar of Contractors lists whatever number the company wrote on its license application - never an 'owner cell' field. For one-to-two-truck shops that number usually IS the owner's cell (no office exists); for 8+ employee companies it's a gatekept office line. Practical rule: for micro shops just dial the listed number, early morning or after 5pm; save paid lookups for the mid-size targets where the office line is a real wall - which is also where the ICP lives.

5. Number Verification and Compliance

Verification stack (confidence is built in layers, not bought in one purchase)

- **Carrier CNAM lookup (~1 cent/number):** returns line type + registered subscriber name. A CNAM name matching the owner = confirmed without a dial. Mobile CNAM coverage is ~50%, line type alone still kills wrong answers.
- **Multi-source agreement (free):** when ZoomInfo results arrive, they are auto-cross-referenced against Apollo numbers - agree / conflict / new - producing a Cell Confidence column.
- **Reverse web search (free):** owner cells leave footprints - company sites, Facebook Marketplace equipment listings, Craigslist ads.
- **Voicemail-greeting check (free, definitive):** an evening dial when nobody answers; the greeting names the owner. ~30 verifications/hour in dead time.
- **Wrong-number telemetry:** 'Wrong Number' is a logged outcome in the tracker; per-source error rates will show which data vendor deserves the next dollar.

Numbers are sticky (porting keeps cells for a decade+); the real risk is misattribution - a live number belonging to an employee or a previous owner. CNAM and the voicemail check both catch exactly that.

Compliance guardrails - read this section, it protects the fund

The monthly-text nurture program carries real TCPA exposure if mishandled: unsolicited automated marketing texts run \$500-\$1,500 per text in statutory damages.

- Texts are sent **manually, one at a time, from a personal phone** - never loaded into a mass-texting platform. Nobody on the SMS list opted in.
- Any reply of STOP or equivalent → status set to OPTED OUT (row turns red) → never contacted again. This is non-negotiable and built into the tracker.
- 4 harvested mobiles sit on the federal Do-Not-Call registry (flagged in the master file). B2B acquisition calls are generally outside DNC telemarketing rules, but those numbers stay OFF the text cadence.
- Recommend a one-hour session with counsel once the SMS list passes ~100 numbers. Four rotating low-pressure text scripts ship on the SMS tab, written to avoid the reactance that hardens a no into a never.

6. Current Status and Next Steps

Where everything stands tonight

Item	Status
Tracker v3 (906 companies loaded, sizes patched)	DELIVERED - awaiting upload to Drive → Save as Google Sheets → share → delete old sheet
Apps Script sync bridge (Code.gs)	DELIVERED - install on the NEW sheet after the swap; send Claude the deployment URL
ICP hot list v2 (143 targets, 43 dial-ready)	DELIVERED - Tier A/A2 callable immediately

Item	Status
Enriched master + ZoomInfo gap list (785 rows w/ per-row needs)	DELIVERED
ZoomInfo trial	Approved, live tomorrow - connect via the ZoomInfo connector (preferred) or browser fallback
Apollo credits	~17,600 enrichment + ~26,400 direct-dial credits unused
Apollo API keys (2) pasted in chat	MUST be revoked/regenerated in Apollo settings

The week's plan

- **Team, now:** dial Tier A/A2 (43 owners). Log every dial. Ask headcount on every call.
- **Xander, 15 min:** sheet swap + bridge install + Apollo key regeneration.
- **Tomorrow (ZoomInfo live):** probe trial entitlements → Tier B/B2 contact reveals (39) → Tier C company sizing (61) → refresh hot list with graduates.
- **This week:** Apollo UI reveal session using existing direct-dial credits; decide on skip-tracing vendor for the long tail; line-type scan when a Twilio account exists.

Asset inventory (all delivered in the working session)

File	What it is
Acquisition_Call_Tracker_v3.xlsx	The team's operating system - convert THIS to Google Sheets
ICP_hotlist_v2.xlsx	143 tiered ICP targets with evidence and confidence
AZ_targets_enriched_master.xlsx	Full 906-row reference: every enrichment column, DNC flags, sources, LinkedIn
ZoomInfo_gap_list.xlsx	785 rows with per-row 'ZoomInfo Needs' for the lookup team
Code.gs	The sheet sync bridge (token redacted from this document)
home_services_crm.html	Companion web CRM for solo sessions (browser-local data)

Prepared with Claude (Cowork) - July 8, 2026. The project knowledge base retains full system documentation; any partner working in this project's Claude sessions inherits this context automatically.
